

1 Motivation and Objectives

- CPS are increasingly everywhere
- many CPS are safety-critical, and a fault can literally kill people
- cyber threats and vulnerabilities are increasingly everywhere
- **key assertion** traditional defense techniques are not only insufficient, they are at least in some cases unnecessary. This assertion is also true for the different paradigm of what we will call “cyber resilience” techniques; i.e. it is unclear whether they are necessary or sufficient
- **another key assertion** security techniques for CPS are usually tailored for that specific application or system. There is no assurance when transitioning to other applications or techniques.
- therefore, we propose to understand the theory and science behind whether, when, and where different CPS security/resilience techniques are (in)effective and/or (un)necessary

Consider the example in Figure 2, where

Our focus is not on improving defenses against cyber attack, or even improving detection and adaptation techniques in the face of a cyber attack. Rather, our efforts aim to

Our approach is to develop models that can...

Figure 1: not sure what to put here.

2 Background and Related Approaches

A bit about traditional defense and its limitations, some of our work (and others’) on resilience, etc

3 Research Goals and Approaches

We propose to focus on three research thrusts that aim to

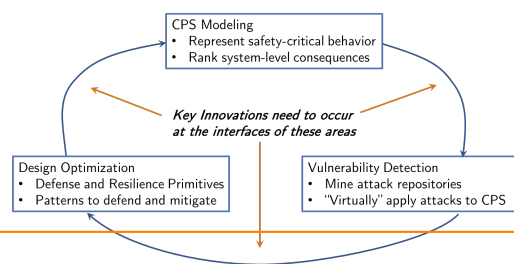

Figure 2: Overview this is just notional, needs a good figure

3.1 Thrust 1: ...

Goals and Challenges:

Approaches and Preliminary Work:

Future Work: If successful, this project will extend our preliminary work by

bold statement about the current state of cyber and safety-critical CPS

catchy example with associated figure

understand the trade-offs and optimize decision-making about when, where, and how to apply design patterns...

1, 2, and 3...

by “future work” I mean the work we’ll do if this

4 Integration and Validation Plan

This multidisciplinary research requires expertise in a number of areas, a tight collaboration among its team members, and a close integration of all phases of the research. The primary expertise needed includes The team consists of experts in all of the areas and the rough team breakdown is shown in Figure 3. The PIs are all members of the Link Lab, whose mission is to enhance excellence of CPS research at the University of Virginia. They and all of their students will be sitting together on a daily basis in a 17,000 square foot collaborative lab. They will formally meet as a group once per week but subgroup meetings and impromptu meetings will take place on a daily basis.

While significant research progress will occur in each subproject, we emphasize a rigorous plan for integration throughout the project. This includes a periodic interactive activity called the

Timeline and milestones:

Figure 3: Proposed experimental testbed will consist of one ground and two aerial vehicles.

5 Broader Impact, Education Plan, and Outreach Activities

Dissemination: The proposed research will enhance the ...

Integration into curriculum: The proposed research will be integrated into coursework
